

ST19NR66-A

Security Target Common Criteria for IT security evaluation

1 Introduction

1.1 Identification

Document identification: ST19NR66-A Security Target.
 Version number: V01.00, issued September 2007.

3. Registration: Registered at STMicroelectronics under number

SMD_ST19NR66_ST_07_001_V01.00.

4. TOE identification: Given in *Chapter 2*.

1.2 Purpose

- This document presents the ST19NR66-A Security Target (ST) of Smartcard Integrated Circuits (ICs), with their Dedicated Software (DSW), designed on the STMicroelectronics ST19N platform.
- 6. This document is a sanitized version of the Security Target used for the evaluation. It is classified as public information.
- 7. The precise references of the Target of Evaluation (TOE) and the secure IC general features are given in *Chapter 2*.
- 8. A glossary of terms and abbreviations used in this document is given in *Appendix A: Glossary* and *Appendix B: Abbreviations*.

1.3 Context

- The Target of Evaluation (TOE) referred in *Chapter 2*, is evaluated under the French IT Security Evaluation and Certification Scheme and is developed by the Smartcard IC division of STMicroelectronics.
- 10. The assurance level of the performed Common Criteria (CC) IT Security Evaluation is EAL 5 augmented. The minimum strength level for the TOE Security Functions (SFs) is SOF-high for all the security functions implemented by the TOE.
- 11. The intent of this Security Target (ST) is to specify the Security Functional Requirements (SFRs) and Security Assurance Requirements (SARs) applicable to the ST19NR66-A secure IC, and to summarise its chosen SFs and assurance measures.
- 12. This ST claims to be an **extended** instantiation of the "Smartcard Integrated Circuit" Protection Profile (PP) registered and certified under the reference *PP/9806* in the French IT Security Evaluation and Certification Scheme. The original text of this PP is typeset as indicated here when it is reproduced in this document.
- 13. This ST claims to be an instantiation of the "Smartcard IC Platform" Protection Profile (PP) registered and certified under the reference BSI-PP-002-2001 in the German IT Security Evaluation and Certification Scheme with the following augmentations:
 - Addition #1: "Support of Cipher Schemes" from AUG
 - Addition #4: "Area based Memory Access Control" from AUG

The original text of this PP is typeset as indicated here, its augmentations from *AUG* as indicated here, when they are reproduced in this document.

- 14. Certifying authorities have recognized both Protection Profiles to lead to comparable chip security evaluations, as stated in "BSI_9806_0002_2001" and in "DCSSI_CCN.624", although with slightly different conclusions with respect to composition, see "DCSSI_CCN.648".
- 15. Extensions introduced in this ST to the SFRs of both Protection Profile (PP) are **exclusively** drawn from the Common Criteria part 2 standard SFRs.
- 16. This ST makes various refinements to the above mentioned PPs. They are all properly identified in the text typeset as *indicated here*. The original text of the PPs is repeated as scarcely as possible in this document for reading convenience. All PPs identifiers have been however prefixed by their respective PP origin label: 9806 for PP/9806, BSI for BSI-PP-002-2001, AUG1 for Addition #1 of AUG and AUG4 for Addition #4 of AUG. This conservative approach leads undoubtedly to some redundancy but enables full traceability.

1.4 Common criteria conformance claims

- 17. The ST19NR66-A Security Target is:
 - PP/9806 conformant, extended with two CCIMB-2004-01-002 SFRs,
 - BSI-PP-002-2001 conformant, augmented with AUG additions #1 and #4,
 - EAL 5 augmented by ALC DVS.2, AVA MSU.3 and AVA VLA.4,
 - The minimum strength of functions level for the SFRs is SOF-high,
 - CCIMB-2004-01-002 extended (as per BSI-PP-002-2001 requirements)
 - CCIMB-2004-01-003 conformant.

2 ST19NR66-A TOE description

2.1 ST19NR66-A product description

- 18. This section describes the ST19NR66-A product as assembly of the highly reliable CMOS ST19N platform.
- 19. The general features of the circuit are:
 - 8-bit processing unit
 - volatile (SRAM) and non volatile memories (ROM and EEPROM)
 - security blocks: Memory Access Control Logic (MACL), clock generator, security administrator, power manager
 - supporting functions: I/O ports (contact and contactless), 8-bit timers,
 Unpredictable Number Generator
- 20. The TOE also includes in the ROM a Dedicated Software which comprises test capabilities (test operating system, called "autotest") and libraries (system ROM library, cryptographic library for DES (EDES implentation), Elliptic Curves Cryptography on GF(p), and RSA algorithm).
- 21. The TOE is a silicon chip with its Dedicated Software.
- 22. The TOE submitted to evaluation does not comprise any specific application: there is no applicative Embedded Software, but the ROM of the tested samples contains an operating system called "Card Manager" that allows the evaluators to use a set of commands with the I/O, and to load test software into EEPROM (or in RAM).
- 23. Figure 1 provides a block diagram overview of the ST19NR66-A.

2.2 Secure IC based product life-cycle

- 24. The secure IC based product life-cycle consists of 7 phases. Each of these phases has the very same boundaries as those defined in both claimed protection profiles.
- 25. The authorities involved in each phase are described in *Table 1*.
- 26. The **limit of the evaluation** defines the scope of responsibility of ST in terms of security. This limit, corresponding to the term "TOE Delivery" of *BSI-PP-002-2001*, is phase 3.
- 27. The limit of **the evaluation** corresponds to phases 2 and 3, including the delivery and verification procedures of phase 1, and the TOE delivery to the IC packaging manufacturer; procedures corresponding to phases 1, 4, 5, 6 and 7 are outside the scope of this **evaluation**.
- 28. Figure 2 describes the secure IC based product lifecycle.

Table 1. Secure IC based product authorities by lifecycle phase

Phase	Name, authority and description
	Secure IC embedded software development:
1	the secure IC embedded software developer is in charge of the secure IC embedded software development and the specification of IC pre-personalization requirements.
	IC development:
2	ST designs the IC, develops IC dedicated software, provides information, software or tools to the <i>secure IC</i> embedded software developer, and receives the <i>secure IC</i> embedded software from the developer, through trusted delivery and verification procedures. From the IC design, IC dedicated software and <i>secure IC</i> embedded software, he constructs the <i>secure IC</i> database, necessary for the IC photomask fabrication.
	IC manufacturing and testing:
3	ST is responsible for producing the IC through three main steps: IC manufacturing, IC testing, and IC pre-personalization.
_	IC packaging and testing:
4	the IC packaging manufacturer is responsible for the IC packaging and testing.
	Secure IC product finishing process:
5	the secure IC product manufacturer is responsible for the secure IC product finishing process and testing.
	Secure IC personalization:
6	the personalizer is responsible for the secure IC personalization and final tests. Other secure IC embedded software may be loaded onto the chip in the personalization process.
	Secure IC end-usage:
7	the secure IC issuer is responsible for the secure IC product delivery to the secure IC end-user and for the end of life process.

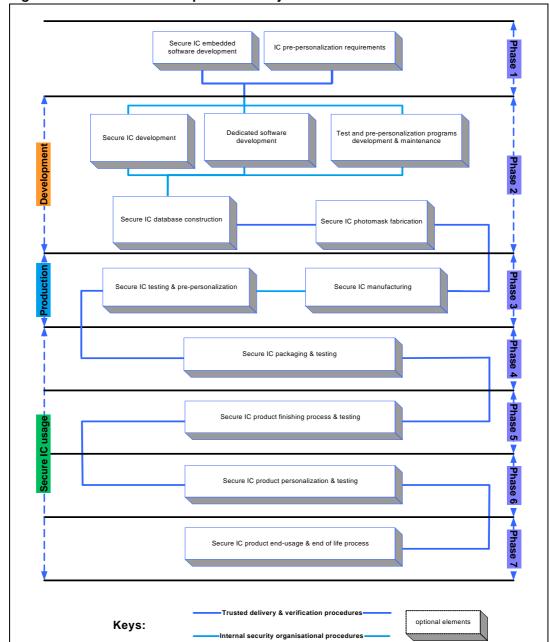

Figure 2. Secure IC based product life-cycle

2.3 TOE environment

- 29. Considering the TOE, three types of environment are defined:
 - Development environment corresponding to phase 2,
 - Production environment corresponding to phase 3,
 - User environment, corresponding to phases 4 up to 7.

2.3.1 TOE development environment

- 30. The development environment is described in the *PP/9806*, section 2.3.1.
- 31. This description has been refined in the *ST19N Generic Security Target* to include industrial parameters whose definition is reproduced hereafter for readers convenience.
- 32. The development centres actually involved in the development of the TOE are the following: **ROUSSET AND ST ANG MO KIO**, for the design activities, **ST ROUSSET**, for the engineering activities and for the software development activities.

2.3.2 TOE production environment

- 33. The production environment is described in the *PP/9806*, section 2.3.2.
- 34. This description has been refined in the *ST19N Generic Security Target* to include industrial parameters whose definition is reproduced hereafter for readers convenience.
- 35. The authorized front-end plant actually involved in the manufacturing of the TOE is **ST ROUSSET**.
- 36. The authorized sub-contractor actually involved in the TOE mask manufacturing can be **DNP Japan** or **DPE Italy**.
- 37. The authorized EWS plant actually involved in the testing of the TOE is ST Rousset.

2.3.3 TOE user environment

38. The TOE User environment is described in the *PP/9806*, section 2.3.3.

2.4 TOE logical phases

- 39. During its construction and usage, the TOE is under several life logical phases. These phases are ordered under a logical controlled sequence. The change from one phase to the next *is under control of the TOE*.
- 40. The logical phases available on the ST19NR66-A are:
 - TEST configuration, then
 - ISSUER configuration, then
 - USER configuration.
- 41. Once into a given configuration, the TOE cannot be stepped back to any previous configuration.
- 42. During phases 4 to 6, the TOE may be in ISSUER or USER configuration according to the SICESW developer request.
- 43. *Table 2* shows what the different TOE configuration can be facing the authorities who perform the phase activities for phases 4 to 7.

Table 2. TOE configurations

Phase & condition	TOE Configuration	Authority
Phase 4	ISSUER or USER	Packaging manufacturer (not ST)
Phase 5	ISSUER or USER	Secure IC product manufacturer (not ST)
Phase 6	ISSUER or USER	Personalizer (not ST)
Phase 7	USER	End-usage

2.5 TOE intended usage

- 44. The TOE can be incorporated in several applications such as:
 - banking and finance market for credit/debit cards, electronic purse (stored value cards) and electronic commerce,
 - network based transaction processing such as mobile phones (GSM SIM cards), pay-TV (subscriber and pay-per-view cards), communication highways (Internet access and transaction processing),
 - transport and ticketing market (access control cards),
 - governmental cards (ID-cards, healthcards, driver licenses etc....),
 - new emerging sectors such as multimedia commerce and Intellectual Property Rights protection.
- 45. The TOE intended usage is further described in the *PP/9806*, section 2.5.

2.6 General IT features of the TOE

- 46. The TOE IT functionality consist of data storage and processing such as:
 - arithmetical functions (e.g. incrementing counters in electronic purses, calculating currency conversion in electronic purses...);
 - data communication;
 - cryptographic operations (e.g. data encryption, digital signature verification...).

3 TOE security environment

- 47. This section describes the security aspects of the environment in which the TOE is intended to be used and addresses the description of the assumptions, the assets to be protected, the threats and the organisational security policies.
- 48. A summary of all these security aspects and their respective conditions is provided in *Table 3*. Note that the origin of each aspect is clearly identified in the prefix of its label
- 49. Most of these security aspects can therefore be easily found in the respective protection profiles. Only those originating in *AUG* are detailed in the following sections.

3.1 Assets

- 50. Assets are security relevant elements of the TOE that include:
 - the application data of the TOE (such as IC pre-personalization requirements, IC and system specific data),
 - the User Data, especially those that can be manipulated and/or disclosed while being stored or processed by the TOE,
 - the secure IC embedded software,
 - the IC dedicated software.
 - the IC specification, design, development tools and technology,
 - TOE's correct operation (including its random number generator and added functionality, if any).
- 51. The TOE itself is therefore an asset.
- 52. Assets have to be protected in terms of confidentiality and integrity.
- 53. In the following, unauthorized disclosure of an asset means that an attacker can determine a meaningful part of the asset that leads to a violation of the security policy enforced by the TOE (TSP).
- 54. In the following, unauthorized modification of an asset means that an attacker can perform an alteration of the asset, meaningful with respect to the security policy enforced by the TOE (TSP), that leads to a violation of the latter.

Additional Specific Security Functionality (Cipher Scheme Suppor			Support)		

3.2 Assumptions

55. The assumptions are described in the *PP/9806*, section 3.2 and in the *BSI-PP-002-2001*, section 3.2. Only those originating in *AUG* are detailed in the following sections.

3.2.1 Assumptions on phase 1

AUG1.A.Key-Function Usage of key-dependent functions:

Key-dependent functions, if any, shall be implemented in the Smartcard Embedded Software in a way that they are not susceptible to leakage attacks (as described under *BSI.T.Leak-Inherent* and *BSI.T.Leak-Forced*).

Note that here the routines that may compromise keys when being executed are part of the Smartcard Embedded Software. In contrast to this the threats *BSI.T.Leak-Inherent* and *BSI.T.Leak-Forced* address (i) the cryptographic routines which are part of the TOE and (ii) the processing of User Data including cryptographic keys.

3.3 Threats

56. The threats are described in the *PP/9806*, section 3.3 and in *BSI-PP-002-2001*, section 3.3. Only those originating in *AUG* are detailed in the following sections.

3.3.1 Threats on phases 2 to 7

Theft or unauthorized use of assets

AUG4.T.Mem-Access Memory Access Violation:

Parts of the Smartcard Embedded Software may cause security violations by accidentally or deliberately accessing restricted data (which may include code). Any restrictions are defined by the security policy of the specific application context and must be implemented by the Smartcard Embedded Software.

Clarification: This threat does not address the proper definition and management of the security rules implemented by the Smartcard Embedded Software, this being a software design and correctness issue. This threat addresses the reliability of the abstract machine targeted by the software implementation. To avert the threat, the set of access rules provided by this TOE should be undefeated if operated according to the provided guidance. The threat is not realized if the Embedded Software is designed or implemented to grant access to restricted information. It is realized if an implemented access denial is granted under unexpected conditions or if the execution machinery does not effectively control a controlled access.

Here the attacker is expected to (i) take advantage of flaws in the design and/or the implementation of the TOE memory access rules (refer to *BSI.T.Abuse-Func* but for functions available after TOE delivery), (I) introduce flaws by forcing operational conditions (refer to *BSI.T.Malfunction*) and/or by physical manipulation (refer to *BSI.T.Phys-Manipulation*). This attacker is expected to have a high level potential of attack.

3.4 Organisational security policies

- 57. The TOE provides specific security functionality that can be used by the Smartcard Embedded Software. In the following specific security functionality is listed which is not derived from threats identified for the TOE's environment because it can only be decided in the context of the smartcard application, against which threats the Smartcard Embedded Software will use the specific security functionality.
- 58. **ST** applies the policy Additional Specific Security Functionality (*AUG1.P.Add Functions*) as specified below.
- 59. **ST** applies the policy Protection during TOE Development and Production (*BSI.P.Process-TOE*) as specified below.
- 60. No other Organisational Security Policy (OSP) has been defined in this ST since their specifications depend heavily on the applications in which the TOE will be integrated. The security targets for the applications embedded in this TOE should further define them.

AUG1.P.Add Functions

Additional Specific Security Functionality:

The TOE shall provide the following specific security functionality to the Smartcard Embedded Software:

- Data Encryption Standard (DES),
- Triple Data Encryption Standard (3DES),
- Elliptic Curves Cryptography on GF(p),
- Secure Hashing (SHA-1),
- Rivest-Shamir-Adleman (RSA),
- Prime Number Generation (Miller-Rabin test)

Note that DES is no longer recommended as an encryption function in the context of smart card applications. Hence, Smartcard Embedded Software may need to use triple DES to achieve a suitable strength, see *AUG1.A.Key-Function*.

4 Security objectives

- 61. The security objectives of the TOE cover principally the following aspects:
 - integrity and confidentiality of assets,
 - protection of the TOE and associated documentation during development and production phases,
 - provide random numbers,
 - provide cryptographic support and access control functionality.
- 62. A summary of all security objectives is provided in Table 4. Note that the origin of each objective is clearly identified in the prefix of its label.
- 63. Most of these security aspects can therefore be easily found in the respective protection profiles. Only those originating in *AUG* are detailed in the following sections.

Table 4. Summary of security objectives

	Label	Title	
	9806.O.TAMPER	Prevent physical tampering of security critical parts	
	BSI.O.Phys-Probing	Protection against Physical Probing	
	BSI.O.Phys-Manipulation	Protection against Physical Manipulation	
	9806.O.CLON	Prevent functional cloning	
	BSI.O.Identification	TOE Identification	
	9806.O.OPERATE	Ensure SF continued correct operation	
	BSI.O.Malfunction	Protection against Malfunctions	
	BSI.O.RND	Random Numbers	
	AUG1.O.Add-Functions	Additional Specific Security Functionality	
10E	9806.O.FLAW	Flawless design, implementation and operation	
-	9806.O.DIS_MECHANISM	Protection of hardware security mechanisms against unauthorized disclosure	
	BSI.O.Abuse-Func	Protection against Abuse of Functionality	
	9806.O.DIS_MEMORY	Protection of sensitive information stored in memories against unauthorized disclosure	
	BSI.O.Leak-Inherent	Protection against Inherent Information Leakage	
	BSI.O.Leak-Forced	Protection against Forced Information Leakage	
	9806.O.MOD_MEMORY	Protection of sensitive information stored in memories against any controlled corruption or unauthorized modification	
	AUG4.O.Mem Access	Area based Memory Access Control	

Table 4. Summary of security objectives (continued)

	Label	Title		
	9806.O.DEV_DIS	Controlled distribution of TOE information for development		
	9806.O.SOFT_DLV	Trusted delivery of secure IC embedded software		
	9806.O.SOFT_MECH	Usage of secure IC as recommended in guidance		
	BSI.OE.Plat-Appl	Usage of Hardware Platform with AUG1.Clarification & AUG4.Clarification		
	BSI.OE.Resp-Appl	Treatment of User Data with AUG1.Clarification & AUG4.Clarification		
	9806.O.DEV_TOOLS	Usage of secure development tools		
	BSI.OE.Process-TOE	Protection during TOE Development and Production		
	9806.O.SOFT_ACS	Controlled access to secure IC embedded software		
nts	9806.O.DESIGN_ACS	Controlled access to the design of the secure IC		
me	9806.O.DSOFT_ACS	Controlled access to the dedicated software		
Environments	9806.O.MECH_ACS	Controlled access to security mechanisms specifications		
Š	9806.O.TI_ACS	Controlled access to security relevant technology		
_	9806.O.MASK_FAB	Protection of mask deliveries and fabrication		
	9806.O.TOE_PRT	TOE protection during production		
	9806.O.IC_DLV	Protection of secure IC during deliveries		
	9806.O.DLV_PROTECT	Protection of TOE material/information under delivery		
	9806.O.DLV_AUDIT	Tracked delivery process		
	9806.O.DLV_RESP	Qualified personnel for delivery		
	BSI.OE.Process-Card	Protection during Packaging, Finishing and Personalisation		
	9806.O.TEST_OPERATE	Test securely operated		
	9806.O.USE_DIAG	Secure communications in user environment		
	9806.O.USE_SYS	Secure system in user environment		

4.1 Security objectives for the TOE

AUG1.O.Add-Functions

Additional Specific Security Functionality:

The TOE must provide the following specific security functionality to the Smartcard Embedded Software:

- Data Encryption Standard (DES),
- Triple Data Encryption Standard (3DES),
- Elliptic Curves Cryptography on GF(p),
- Secure Hashing (SHA-1),
- Rivest-Shamir-Adleman (RSA),
- Prime Number Generation (Miller-Rabin test).

AUG4.O.Mem Access

Area based Memory Access Control:

The TOE must provide the Smartcard Embedded Software with the capability to define restricted access memory areas. The TOE must then enforce the partitioning of such memory areas so that access of software to memory areas is controlled as required, for example, in a multi-application environment.

4.2 Security objectives for the environment

4.2.1 Objectives on phase 1

BSI.OE.Plat-Appl

Usage of Hardware Platform:

To ensure that the TOE is used in a secure manner the Smartcard Embedded Software shall be designed so that the requirements from the following documents are met:

- (i)hardware data sheet for the TOE,
- (ii)TOE application notes dedicated software user manuals,
- (iii)TOE security user guidance, and
- (iii)findings of the TOE evaluation reports relevant for the Smartcard Embedded Software.

AUG1.Clarification: When the TOE supports cipher schemes as additional specific security functionality and if required, the Smartcard Embedded Software shall use these cryptographic services of the TOE and their interface as specified. When key-dependent functions implemented in the Smartcard Embedded Software are just being executed, the Smartcard Embedded Software must provide protection against disclosure of confidential data (User Data) stored and/or processed in the TOE by using the methods described under "Inherent Information Leakage" (*BSI.T.Leak-Inherent*) and "Forced Information Leakage" (*BSI.T.Leak-Forced*).

AUG4.Clarification: For the separation of different applications, the Smartcard Embedded Software may implement a memory management scheme based upon security mechanisms of the TOE as required by the security policy defined for the specific application context.

BSI.OE.Resp-Appl

Treatment of User Data:

Security relevant User Data (especially cryptographic keys) are treated by the Smartcard Embedded Software as required by the security needs of the specific application context.

For example the Smartcard Embedded Software will not disclose security relevant user data to unauthorised users or processes when communicating with a terminal.

AUG1.Clarification: By definition cipher or plain text data and cryptographic keys are User Data. The Smartcard Embedded Software shall treat these data appropriately, use only proper secret keys (chosen from a large key space) as input for the cryptographic function of the TOE and use keys and functions appropriately in order to ensure the strength of cryptographic operation.

This means that keys are treated as confidential as soon as they are generated. The keys must be unique with a very high probability, as well as cryptographically strong. For example, it must be ensured that it is beyond practicality to derive the private key from a public key if asymmetric algorithms are used. If keys are imported into the TOE and/or derived from other keys, quality and confidentiality must be maintained. This implies that appropriate key management has to be realised in the environment.

AUG4.Clarification: The treatment of User Data is still required when a multi-application operating system is implemented as part of the Smartcard Embedded Software on the TOE. In this case the multi-application operating system should not disclose security relevant user data of one application to another application when it is processed or stored on the TOE.

4.3 Security objectives rationale

- 64. The security objectives rationale has been established for the whole ST19N platform and has been presented and evaluated in the *ST19N Generic Security Target*.
- 65. For confidentiality reasons, this rationale is not reproduced here.

5 Security requirements

66. This chapter on security requirements contains a section on security functional requirements (SFRs) for the TOE (Section 5.1), a section on security assurance requirements (SARs) for the TOE (Section 5.2), a section on the refinements of these SARs (Section 5.3) and a section on security requirements for the environment (Section 5.4) as required by the "BSI-PP-002-2001" Protection Profile. This chapter includes a section with the security requirements rationale (Section 5.5).

5.1 Security functional requirements for the TOE

- 67. Security Functional Requirements (SFRs) from the "*PP/9806*" Protection Profile (PP) are **exclusively** drawn from *CCIMB-2004-01-002*.
- 68. The following SFRs from the "BSI-PP-002-2001" Protection Profile are **extensions** to CCIMB-2004-01-002:
 - FCS_RND Generation of random numbers,
 - FMT_LIM Limited capabilities and availability,
 - FAU_SAS Audit data storage.

The reader can find their certified definitions in the text of the "BSI-PP-002-2001" Protection Profile.

- 69. All extensions to the SFRs of the "*PP/9806*" and of the "*BSI-PP-002-2001*" Protection Profiles (PPs) are **exclusively** drawn from *CCIMB-2004-01-002*.
- 70. All <u>iterations</u>, <u>assignments</u>, <u>selections</u>, or <u>refinements</u> on SFRs have been performed according to section 4.4.1.3.2 of *CCIMB-2004-01-001*. They are easily identified in the following text as they appear *as indicated here*. Note that in order to improve readability, <u>iterations</u> are often expressed within tables.
- 71. The rules defined by the TOE Security Policy during phase 3 (access control and information flow control Security Functions Policies) *are* different from those prevailing during phases 4 to 7.
- 72. Since the TOE can be in the ISSUER configuration in Phases 4 to 6, as specified in *Table 2*, the functional requirements applicable only to phase 3 in the *PP/9806*, are refined into the functional requirements applicable to *the logical phases TEST and ISSUER configurations (TST&ISR, for short)*.
- 73. The minimum strength of function level for the TOE security functions is SOF-high.
- 74. In order to ease the definition and the understanding of these security functional requirements, a simplified presentation of the TOE Security Policy (TSP) is given in the following section. For confidentiality reasons, security attributes and their related policies, TSF data, user data and acceptance/deny rules enforced by the TSF are not described in this document.
- 75. The selected security functional requirements for the TOE and their respective origin and type are summarized in the following pages in *Table 5*.

5.1.1 Subjects, objects, operations and data

76. This section introduces in turn subjects, objects and operations relevant to the definition of the TSP.

Table 5. Summary of functional security requirements for the TOE

		Cryptographic key generation	support	Security Target Operated	2004-01- 002

Subjects

77. For any given TOE of the ST19N platform, the TSP identifies the following subjects:

S.TRUST	ST trusted process always activated by a power on of the TOE. This process exhibits three different behaviours according to the TOE configuration. Please note that this process denotes all the active resources of the TOE controlled by the TSF, not only the executing DSW.
S.PLAIN	Untrusted process activated by <i>S.TRUST</i> . This process denotes all the active resources of the TOE not controlled by the TSF, notably the SICESW in USER configuration.
S.LIB	ST trusted functional process activated during a call to execute a service available in the ST library when the TOE is in USER configuration. This process denotes only the executing DSW.
S.ANY	Any human user that can get access to the TOE either locally (i.e. that interacts with the TOE via TOE devices) or remotely (i.e. that interacts with the TOE via another IT product) when the TOE is in any configuration.

Objects and operations

78. For any given TOE of the ST19N platform, the TSP identifies the following objects with their associated operations. For confidentiality reasons, those objects are not completely described here.

OB. F _IC	Secure IC carrying the TOE in any of its forms.
OB.ROM	Any part of the Read Only Memory. These objects contain executable programs and/or data of ST and of the user (ST_ROM & USR_ROM). The latter may also reside in <i>OB.NVM</i> .
OB.RAM	Any part of the Volatile Memory. These objects are used for processing user and TSF data.
OB.REG	Any Register of the TOE. These objects are used to control TOE resources and to exchange data with the secure IC internal subjects.
OB.NVM	Non Volatile Memory that contains user data, TSF data and/or user programs.
OB.CMD_TST	Any command available to the user when the TOE is in TEST configuration.
OB.CMD_ISR	Any command available to the user when the TOE is in ISSUER configuration.
OB.CALL_USR	Any ST library service available to the user when the TOE is in USER configuration.

5.1.2 Functional requirements applicable to TST&ISR

User attribute definition (FIA_ATD.1)

- 79. The TSF shall maintain the following list of security attributes belonging to individual users:
 - the TOE configuration,
 - the user authentication status.

User identification before any action (FIA_UID.2)

80. The TSF shall require each user to identify itself before allowing any other TSF mediated actions on behalf of that user.

User authentication before any action (FIA_UAU.2)

81. The TOE Security Functions (TSF) shall require each user to be successfully authenticated before allowing any other TSF mediated actions on behalf of that user.

TOE Security Functions testing (FPT_TST.1)

- 82. The TSF shall run a suite of self tests at the request of the authorised user and at **TOE operating conditions** to demonstrate the correct operation of the TSF.
- 83. The TSF shall provide authorised users with the capability to verify the integrity of *the TSF data*.
- 84. The TSF shall provide authorised users with the capability to verify the integrity of stored TSF executable code.

Stored data integrity monitoring (FDP_SDI.1)

85. The TSF shall monitor user data stored within the TSC for *user ROM or NVM* personalization integrity errors on all objects, based on the following attributes: memory content signature.

Audit storage (FAU_SAS.1)

86. The TSF shall provide *test personnel before TOE Delivery* with the capability to store the *Initialisation Data and/or Pre-personalisation Data and/or supplements of the Smartcard Embedded Software* in the audit records.

Clarification:

- test personnel before TOE Delivery, means TEST administrator if TOE delivery is in ISSUER configuration,
- test personnel before TOE Delivery, means TEST administrator and/or ISSUER administrator if TOE delivery is in USER configuration.

5.1.3 Functional requirements applicable to Phases 3 to 7

Security roles (FMT_SMR.1)

- 87. The TSF shall maintain the *following* roles:
 - TEST administrator: this role allows to perform the test of the TOE in a secure environment.
 - ISSUER administrator: this role allows to perform reduced test operations and personalization of the TOE if needed during phases 4 to 6.
 - USER: this role has capabilities defined by the SICESW functionality and the ST library services in the DSW. The functionality available to the USER role is dependent on the SICESW, the pre-personalization and the customer mask options.
- 88. The TSF shall be able to associate users with roles.

Management of security functions behaviour (FMT MOF.1)

89. The TOE Security Functions shall restrict the ability to *perform as indicated in Table 6*on the functions *listed in Table 6* to the authorised identified roles in Table 6.

Table 6. FMT_MOF.1 iterations (management of security functions behaviour)

[selection: determine the behaviour of, disable, enable, modify the behaviour of]	[assignment: list of functions]	[assignment: the authorised identified roles]	
	- SF_INIT_A		
	- SF_CONFIG_A		
	- SF_INT_A		
Modify the behaviour of	- SF_AUTH_A	TEST administrator	
	- SF_TEST_A		
	- SF_ADMINIS_A		
	- SF_OBS_A		
	- SF_CONFIG_A		
	- SF_INT_A		
Madify the behaviour of	- SF_AUTH_A	ISSUER administrator	
Modify the behaviour of	- SF_TEST_A	1330En auministrator	
	- SF_ADMINIS_A		
	- SF_ALEA_A		

Static attribute initialisation (FMT_MSA.3)

- 90. The TSF shall enforce the *Location Based Access Control Policy and the Construction Flow Control Policy* to provide default values for security attributes that are used to enforce the security function policy *as indicated in Table 7*.
- 91. The TOE Security Functions shall allow the *authorised identified roles in Table 7* to specify alternate initial values to override the default values when an object or information is created.

Management of security attributes (FMT_MSA.1)

92. The TSF shall enforce the Location Based Access Control Policy and the Construction Flow Control Policy to restrict the ability to perform operations in Table 7 to security attributes in Table 7 to the authorised identified roles in Table 7.

Table 7. FMT MSA.3 and FMT MSA.1 iterations (initialisation and management)

[assignment: list of security	[selection: choose any of restrictive, permissive,	FMT_MSA.3 [assignment: the authorised identified	FMT_MSA.1 [selection: change_default, query, modify, delete, [assignment: other operations]]	
	[assignment: other property]]	roles]	[assignment: the authorised identified roles]	
For confidentiality reasons, this table content is detailed in the ST19N Generic Security Target				

Specification of management functions (FMT_SMF.1)

- 93. The TOE Security Functions shall be capable of performing the following security management function:
 - Modifying the TOE configuration
 - Authenticating the TEST administrator and the ISSUER administrator
 - Modifying the security functions behaviour as indicated in Table 6

Limited capabilities (FMT_LIM.1)

94. The TSF shall be designed in a manner that limits their capabilities so that in conjunction with "Limited availability (FMT_LIM.2)" the following policy is enforced: Limited capability and availability Policy.

Limited availability (FMT_LIM.2)

- 95. The TSF shall be designed in a manner that limits their availability so that in conjunction with "Limited capabilities (FMT_LIM.1)" the following policy is enforced: Limited capability and availability Policy.
- 96. SFP_1: Limited capability and availability Policy Deploying Test Features after TOE Delivery does not allow User Data to be disclosed or manipulated, TSF data to be disclosed or manipulated, software to be reconstructed and no substantial information about construction of TSF to be gathered which may enable other attacks.
- 97. Refinement:

Test Features are those provided by the commands in the DSW:

- OB.CMD_TST, if TOE delivery is in ISSUER configuration;
- OB.CMD TST and OB.CMD ISR, if TOE delivery is in USER configuration.

Complete access control (FDP_ACC.2)

- 98. The TOE Security Functions shall enforce the *Location Based Access Control Policy* on *all subjects and objects in Table 8* and all operations among subjects and objects covered by the SFP.
- 99. The TOE Security Functions shall ensure that all operations between any subject in the TOE Scope of Control and any object within the TOE Scope of Control are covered by an access control security functions policy.
- 100. For confidentiality reasons, rules are not shown in *Table 8*. They can be found in the *ST19N Generic Security Target*.

Table 8. Subjects, objects and applicable access control rules

Subjects Objects	S.TRUST	S.PLAIN	S.LIB	S.ANY
OB.F_IC		Not applicable		
OB.ROM	Memory Acc	cess Control Logics (I	MACL) rules	
OB.CALL_USR	System Acc			
OB.CMD_TST	Test Acce			
OB.CMD_ISR	Issuer Acc	Not applicable		
OB.REG	Register Ac	Not applicable		
OB.RAM	Memory Acc			
OB.NVM	Page Access Control Logics (PACL) rules			
	Lo	ock Logics (LOCK) rul	es	

Security attribute based access control (FDP_ACF.1)

- 101. The TOE Security Functions shall enforce *Location Based Access Control Policy* to objects based on *security attributes* defined in the *ST19N Generic Security Target*.
- 102. The TOE Security Functions shall enforce the following rules to determine if an operation among controlled subjects and controlled objects is allowed:
 - Grant S.TRUST initialisation access to OB.RAM and OB.REG.
 - Grant S.TRUST flash access to OB.NVM.
 - Those in Table 13 of the ST19N Generic Security Target.
 - Those in Table 14 of the ST19N Generic Security Target, when TOE is not in test configuration.
- 103. The TOE Security Functions shall explicitly authorise access of subjects to objects based on the following additional rules: *None.*
- 104. The TOE Security Functions shall explicitly deny access of subjects to objects based on the following additional rules:
 - Those "explicitly denied" of Table 13 and Table 14 of the ST19N Generic Security Target.

For confidentiality reasons, Table 13 and Table 14 are not shown in this document. They can be found in the *ST19N Generic Security Target*.

Limited fault tolerance (FRU_FLT.2)

105. The TSF shall ensure the operation of all the TOE's capabilities when the following failures occur: exposure to operating conditions which are not detected according to the requirement Failure with preservation of secure state (FPT_FLS.1).

Failure with preservation of secure state (FPT_FLS.1)

106. The TSF shall preserve a secure state when the following types of failures occur: exposure to operating conditions which may not be tolerated according to the requirement Limited fault tolerance (FRU_FLT.2) and where therefore a malfunction could occur.

107. Refinement:

The term "failure" above means "circumstances". The TOE prevents failures for the "circumstances" defined above.

Regarding application note 16 of *BSI-PP-002-2001*, the TOE provides information on the operating conditions monitored during Smartcard Embedded Software execution and after a warm reset. No audit requirement is however selected in this security target.

Potential violation analysis (FAU_SAA.1)

- 108. The TOE Security Functions shall be able to apply a set of rules in monitoring the audited events and based upon these rules indicate a potential violation of the TOE Security Policy.
- 109. The TOE Security Functions shall enforce the following rules for monitoring audited events:
 - a) Accumulation or combination of auditable events *in ISSUER and USER configurations, resulting from:*
 - operating changes by the environment,
 - access control violation attempts,
 - bad NVM or CPU usages,

known to indicate a potential security violation;

b) Make these indications available to the user after a warm reset.

TSF domain separation (FPT SEP.1)

- 110. The TSF shall maintain a security domain for its own execution that protects it from interference and tampering by untrusted subjects.
- 111. The TSF shall enforce separation between the security domains of subjects in the TSC.
- 112. Refinement:

Those parts of the TOE that support the security functional requirements "Limited fault tolerance (FRU_FLT.2)" and "Failure with preservation of secure state (FPT_FLS.1)" shall be protected from interference of the Smartcard Embedded Software.

Stored data integrity monitoring and action (FDP_SDI.2)

- 113. The TSF shall monitor user data stored within the TSC for:
 - single bit fails upon a read operation,
 - other actions are not described here,

in OB.NVM, on all objects, based on the following attributes: redundancy data.

114. Upon detection of a data integrity error, the TSF shall perform actions that cannot be described here, for confidentiality reasons.

Notification of physical attack (FPT_PHP.2)

- 115. The TOE Security Functions shall provide unambiguous detection of physical tampering that might compromise the TOE Security Functions.
- 116. The TOE Security Functions shall provide the capability to determine whether physical tampering with the TOE security function's devices or elements has occurred.
- 117. For the *clock and voltage supply operating changes by the environment in ISSUER and USER configurations*, the TOE security functions shall monitor the devices and elements and notify the *ISSUER administrator or the USER* when physical tampering with the TOE security functions devices has occurred.

Resistance to physical attack (FPT PHP.3)

- 118. The TOE Security Functions shall resist *physical manipulation and physical probing*, to the *TSF* by responding automatically such that the TOE security policy is not violated.
- 119. Note: as described in the CC part 2 annexes, technology limitations and relative physical exposure of the TOE must be considered.
- 120. Refinement

The TOE will implement appropriate measures to continuously counter physical manipulation and physical probing. Due to the nature of these attacks (especially manipulation) the TOE can by no means detect attacks on all of its elements. Therefore, permanent protection against these attacks is required ensuring that the TSP could not be violated at any time. Hence, "automatic response" means here (i) assuming that there might be an attack at any time and (ii) countermeasures are provided at any time.

Unobservability (FPR UNO.1)

- 121. In this security target, <u>ability to observe an operation</u> means revealing the value of a data during an operation on this data.
- 122. The TOE Security Functions shall ensure that **all end-users** are unable to observe the operations **listed in Table 9** on **objects listed in Table 9** by **S.TRUST and S.LIB**.

Table 9. FPR_UNO.1 iterations (unobservability)

[assignment: list of operations]	[assignment: list of objects]
read	OB.ROM, OB.RAM, OB.REG and OB.NVM
write	OB.RAM
program, erase	OB.NVM

Basic internal transfer protection (FDP_ITT.1)

123. The TSF shall enforce the *Data Processing Policy* to prevent the *disclosure* of user data when it is transmitted between physically-separated parts of the TOE.

Basic internal TSF data transfer protection (FPT ITT.1)

- 124. The TSF shall protect TSF data from *disclosure* when it is transmitted between separate parts of the TOE.
- 125. Refinement:

The different memories, the CPU and other functional units of the TOE (e.g. a cryptographic co-processor) are seen as separated parts of the TOE.

This requirement is equivalent to FDP_ITT.1 above but refers to TSF data instead of User Data. Therefore, it should be understood as to refer to the same *Data Processing Policy*.

126. SFP_2: Data Processing Policy

User Data and TSF data shall not be accessible from the TOE except when the Smartcard Embedded Software decides to communicate the User Data via an external interface. The protection shall be applied to confidential data only but without the distinction of attributes controlled by the Smartcard Embedded Software.

Subset information flow control (FDP IFC.1)

127. The TOE Security Functions shall enforce the *Construction Flow Control Policy* on all subjects defined in Subjects, the content of all objects defined in Objects and operations, and the commands available in OB.CMD_TST, OB.CMD_ISR and OB.CALL_USR objects.

Simple security attributes (FDP_IFF.1)

- 128. The TOE Security Functions shall enforce the *Construction Flow Control Policy* based on the following types of subject and information security attribute:
 - subject and object locations and TOE configuration.
- 129. The TOE Security Functions shall permit an information flow between a controlled subject and a controlled information via a controlled operation if the following rules hold:
 - Those in Table 16 of the ST19N Generic Security Target.
- 130. The TSF shall provide the additional information flow control SFP rules: *None*.
- 131. The TSF shall enforce the following additional SFP capabilities: *Data Processing Policy*.
- 132. The TSF shall explicitly authorise an information flow based on the following rules: **None**.
- 133. The TSF shall explicitly deny an information flow based on the following rules: None.

Subset residual information protection (FDP_RIP.1)

134. The TSF shall ensure that any previous information content of a resource is made unavailable upon *the allocation of the resource to*, *deallocation of the resource from* the following objects: *OB.RAM objects and OB.REG objects but the illegal condition register and the CRC control register when in warm reset*.

Quality metric for random numbers (FCS_RND.1)

135. The TSF shall provide a mechanism to generate random numbers that meet NIST FIPS PUB-140-2:1999 standard for a Security Level 3 cryptographic module (statistical test upon demand) and P2 class of BSI-AIS31.

5.1.4 Functional requirements applicable to user configuration

Cryptographic operation (FCS_COP.1)

136. The TSF shall perform *the operations in Table 10* in accordance with a specified cryptographic algorithm *in Table 10* and cryptographic key sizes *of Table 10* that meet the *standards in Table 10*.

Table 10. FCS_COP.1 iterations (cryptographic operations)

[assignment: list of cryptographic operations]	[assignment: cryptographic algorithm]	[assignment: cryptographic key sizes]	[assignment: list of standards]
encryptiondecryption	Data Encryption Standard (DES)	56 effective bits	ISO 8372:1987
in Electronic Code Book (ECB) mode	Triple Data Encryption Standard (3DES)	112 effective bits	ISO 8731-1:1987 ISO/IEC 10116:1997
encryptiondecryption	Data Encryption Standard (DES)	56 effective bits	
in Cipher Block Chaining (CBC) mode – compute a Message Authentication Code (MAC)	Triple Data Encryption Standard (3DES)	112 effective bits	ISO 8372:1987 ISO 8731-1:1987 ISO/IEC 9797:1994 ISO/IEC 10116:1997
points addition,point doubling,point multiplication	Elliptic Curves Cryptography on GF(p)	up to 256 bits	IEEE 1363-2000
– RSA recovery		multiples of 64 bits up to 1088 bits	
(encryption)		multiples of 64 bits larger than 1088 bits and up to 2176 bits	
- RSA signature (decryption) without the Chinese Remainder Theorem	Rivest, Shamir & Adleman's	multiples of 64 bits up to 1088 bits	ISO/IEC 9796-2:1997 MIT/LCS/TR-212
- RSA signature (decryption) with the Chinese Remainder Theorem	RSA signature (decryption) ith the Chinese		
- secure hash function	revised Secure Hash Algorithm (SHA-1)	this algorithm has no key, so the assignment is pointless ⁽¹⁾	Not applicable

^{1.} result size of 160 bits on chained blocks of 512 bits

Cryptographic key generation (FCS_CKM.1)

137. The TSF shall generate cryptographic keys in accordance with a specified cryptographic key generation algorithm, *in Table 11*, and specified cryptographic key sizes *of Table 11* that meet the following *standards in Table 11*.

Table 11. FCS_CKM.1 iterations (cryptographic key generation)

Iteration label	[assignment: cryptographic key generation algorithm]	[assignment: cryptographic key sizes]	[assignment: list of standards]
[COP_RSA_RANDOM] ⁽¹⁾	random number generation	1088 bits	Not applicable
[COP_RSA_PRIMES]	primes and RSA primes generation algorithm	multiples of 64 bits up to 1088 bits	NIST FIPS PUB-140- 2:1999 ISO/IEC 9796-2:1997 NIST FIPS PUB 186 JoCSS JoNT
[COP_RSA_KEYS]	RSA public and private keys computation algorithm	multiples of 64 bits greater than 128 bits and up to 2176 bits	NIST FIPS PUB-140- 2:1999 ISO/IEC 9796-2:1997 MIT/LCS/TR-212

Note that this requirement is complementary to FCS_RND.1. The former asks for random numbers ready to use in a cipher scheme, as it is clearly recommended in paragraph n° 693 of CCIMB-2004-01-002, whereas the latter insists on the quality of the random source.

5.2 TOE security assurance requirements

- **138.** The assurance requirements **are** EAL **5** augmented of additional assurance components listed in the following sections.
- 139. *The components introduced by the PP/9806 and BSI-PP-002-2001* are hierarchical to the components specified in EAL *5*.
- 140. The augmentations relative to EAL *5* are the following:
 - ALC_DVS.2 Sufficiency of security measures
 This increases the confidence in the vital area of developer security measures to the highest CC level,
 - AVA_MSU.3 Analysis and testing for insecure states
 This adds evaluator testing of the potential for misuse of the TOE within the evaluation scope,
 - AVA_VLA.4 Highly resistant
 This increases the attack potential assumed for the vulnerability analysis and penetration testing to its highest CC level.
- 141. Regarding application note 18 of *BSI-PP-002-2001*, the continuously increasing maturity level of evaluations of Smartcard ICs justifies the selection of a higher-level assurance package.
- 142. The set of security assurance requirements (SARs) is presented in *Table 12*, indicating the origin of the requirement.

Table 12. TOE security assurance requirements

Label	Title	Origin
ACM_AUT.1	Partial CM automation	EAL5/BSI-PP-002- 2001/PP/9806
ACM_CAP.4	Generation support and acceptance procedures	EAL5/ <i>BSI-PP-002-</i> 2001/ <i>PP/9806</i>

5.3 Refinement of the security assurance requirements

- 143. As BSI-PP-002-2001 defines refinement for selected SARs, these refinements are also claimed in this security target. PP/9806 defines no refinement on SARs.
- 144. The main customizing is that the Dedicated Software is an operational part of the TOE after delivery, although the Test Dedicated Software is no more available.
- 145. Regarding application note 19 of BSI-PP-002-2001, the refinements for all the assurance families have been reviewed for the hierarchically higher-level assurance components selected in this security target.
- 146. The text of the impacted refinements of BSI-PP-002-2001 is to be found in the ST19N Generic Security Target.
- 147. For reader's ease, an impact summary is provided in *Table 13*.

Table 13. Impact of EAL5 selection on BSI-PP-002-2001 refinements

Assurance Family	BSI-PP-002-2001 Level	ST Level	Impact on refinement	
ADO_DEL	2	2	None	
ALC_DVS	2	2	None	
ACM_SCP	2	3	None, refinement is still valid	
ACM_CAP	4	4	None	
ADV_FSP	2	3	Presentation style changes	
ATE_COV	2	2	Dedicated Software is included	
ADO_IGS	1	1	Difference on ISSUER or USER delivery	
AGD_USR	1	1	Terminal is not a direct user	
AGD_ADM	1	1	Difference on ISSUER or USER delivery	

5.4 Security requirements for the environment

148. Although security requirements specified below are respectively applicable:

- to the smart card embedded software for those in Section 5.4.1.
- to the embedded software developer and the card manufacturer for those in Section 5.4.2,
- 149. it is neither necessary nor appropriate for this security target to define functional and assurance security requirements for the TOE environment (a). These are however included here to comply with the claimed protection profiles.

The TOE being a product-type TOE, dependencies on the environment should remain at the assumption and security objective levels because they are not in the scope of the evaluation (as a matter of fact, they will not be evaluated). Satisfaction of these requirements is a design issue for the smart card embedded software developer and a design/organizational issue for the card manufacturer. They should state and provide evidence on how they comply with these "safe conditions of use" of the product in order to claim, as element of evidence, the certification report of a TOE in a composite evaluation. Evaluators of the composite TOE should then evaluate and test this provided evidence.

5.4.1 Security requirements for the operational IT environment

150. *BSI-PP-002-2001* selects no security requirement for the IT operational environment. However, the extra functionality provided by the ST19NR66-A, introduced in this security target as recommended in *AUG*, results in the security requirements summarized in *Table 14*.

Table 14. Summary of security requirements for the operational IT environment

AUG1.RE.Cipher

Cipher Schemas

The developers of Smartcard Embedded Software must not implement routines in a way which may compromise keys when the routines are executed as part of the Smartcard Embedded Software. Performing functions which access cryptographic keys could allow an attacker to misuse these functions to gather information about the key which is used in the computation of the function.

Keys must be kept confidential as soon as they are generated. The keys must be unique with a very high probability, as well as cryptographically strong. For example, it must be ensured that it is not possible to derive the private key from a public key if asymmetric algorithms are used. If keys are imported into the TOE and/or derived from other keys, quality and confidentiality must be maintained. This implies that an appropriate key management has to be realised in the environment.

5.5 Security requirements rationale

- 153. The security requirements rationale has been established for the whole ST19N platform and has been presented and evaluated in the *ST19N Generic Security Target*.
- 154. For confidentiality reasons, this rationale is not reproduced here.

6 TOE summary specification

6.1 Statement of TOE security functions

155. The following security functions are an abstraction of the TOE Functional Specification.

6.1.1 SF_INIT_A: Hardware initialisation & TOE attribute initialisation

156. In TEST, ISSUER and USER configurations, this functionality ensures the following:

- the TOE starts running in a secure state,
- the TOE is securely initialised,
- the reset operation is correctly managed.

6.1.2 SF_CONFIG_A: TOE configuration switching and control

- 157. In TEST, ISSUER and USER configurations, this functionality ensures the switching and the control of TOE configuration.
- 158. This functionality ensures that the TOE is either in TEST, ISSUER or USER configuration.
- 159. The only authorised TOE configuration modifications are:
 - TEST to ISSUER configuration by TEST administrator,
 - ISSUER to USER configuration by ISSUER administrator.
- 160. This functionality is responsible for the TOE configuration detection and notification to the other resources of the TOE.

6.1.3 SF_INT_A: TOE logical integrity

- 161. This functionality is responsible for the following operations, performed according to actual TOE configuration:
 - NVM, USR_ROM and ST_ROM integrity content verifications in TEST and ISSUER configurations,
 - valid CPU usage and stack overflow verification in TEST, ISSUER and USER configurations.
 - for correcting single bit fails upon a read operation,
 - other actions are not described here.
- 162. This functionality is responsible for reporting to SF_ADMINIS_A detected errors on CPU usage, stack overflow and EEPROM.

6.1.4 SF TEST A: Test of the TOE

- 163. This functionality is responsible for restricting access of the TOE TEST functionality to the TEST administrator in TEST configuration.
- 164. This functionality is responsible for restricting access of the TOE ISSUER functionality to the ISSUER administrator in ISSUER configuration.
- 165. In USER configuration, this functionality ensures that neither TOE TEST nor TOE ISSUER functionality can be accessed.
- 166. In TEST configuration, this functionality ensures the test of TOE functionality with respect to the IC specification.
- 167. In ISSUER and USER configurations, it ensures that critical test functionality is disabled.
- 168. In TEST configuration, this functionality provides commands to store data and/or prepersonalisation data and/or supplements of the Smartcard Embedded Software (personalisation). In ISSUER configuration, these commands are still available but in a more restricted operation mode.

6.1.5 SF AUTH A: Administrators authentication

- 169. In TEST configuration, this SF ensures that the only allowed TOE user is an authenticated TEST administrator.
- 170. In ISSUER configuration, this SF ensures the authentication of the ISSUER administrator.
- 171. A SOF-high strength of function is claimed for this SF.

6.1.6 SF_FWL_A: Storage and Function Access Firewall

- 172. TOE memories are partitioned. This partitioning is partially defined by the TOE user and partially by ST:
 - ST_ROM mapping is ST defined,
 - USR ROM mapping is user defined,
 - RAM and NVM mappings are partly ST defined and partly user defined.
- 173. In TEST, ISSUER and USER configurations, this security functionality monitors:
 - access from memory locations to other locations for ROM, RAM and NVM,
 - NVM use,
 - register access,

and is responsible for the notification of violation attempts to SF_ADMINIS_A.

- 174. An access can be:
 - a read, to registers, ROM, RAM or NVM,
 - a write, to registers or RAM,
 - a program, to NVM,
 - an erase, to NVM.
- 175. Executability, Read, Write, Program and Erase right classes are defined by the user and ST for ROM, RAM and NVM.

6.1.7 SF_PHT_A: Physical tampering security function

176. In TEST, ISSUER and USER configurations, this functionality ensures the following:

- the TOE detects clock and voltage supply operating changes by the environment,
- the TOE detects attempts to violate its physical integrity,
- the TOE is always clocked with shape and timing within specified operating conditions.

6.1.8 SF_ADMINIS_A: Security violation administrator

177. In TEST, ISSUER and USER configurations, this functionality ensures the management of security violations attempts.

178. The security violations attempts which are managed are:

- access to unavailable or reserved memory locations,
- unauthorised access to user memories,
- unauthorised access to ST memories,
- bad CPU usage,
- bad NVM use,
- EEPROM single bit fails,
- clock and voltage supply operating changes,
- TOE physical integrity abuse.

6.1.9 SF_OBS_A: Unobservability

179. In ISSUER and USER configurations, this security function addresses the *Unobservability (FPR_UNO.1)*, the *Basic internal transfer protection (FDP_ITT.1)* and the *Basic internal TSF data transfer protection (FPT_ITT.1)* security functional requirements expressed in this document.

6.1.10 SF SKCS A: Symmetric Key Cryptography Support

180. In USER configuration, this security function implements the following standard symmetric key cryptography algorithms:

- Data Encryption Standard (DES) with 64 bits long keys (56 effective bits).
 This functionality supports the following standard modes of operation, both for encryption and for decryption:
- DES by itself,
- Triple DES, chaining two DES encryption and one DES decryption.

Each of these modes of operation can be chained in the standard Cipher Block Chaining mode (CBC). In the encryption operation mode, this function can compute either a 64 bits long Message Authentication Code (MAC) or the encrypted data.

6.1.11 SF_AKCS_A: Asymmetric Key Cryptography Support

- 181. In USER configuration, this security function implements the following standard asymmetric key cryptography algorithms:
 - RSA verification (encryption) with an RSA modulo up to 1088 bits,
 - RSA verification (encryption) with an RSA modulo up to 2176 bits,
 - RSA signature (decryption) without the Chinese Remainder Theorem (CRT), with an RSA modulo up to 1088 bits,
 - RSA signature (decryption) with the Chinese Remainder Theorem (CRT), with an RSA modulo up to 2176 bits,
 - RSA secret and public keys computation with an RSA modulo up to 2176 bits,
 - Prime number and RSA prime number generation up to 1088 bits, with Rabin-Miller primality tests.
- 182. In USER configuration, if an ST19NR66-A Elliptic Curves Cryptography on prime fields GF(p) coprocessing module is included in the TOE (M_COP(EC_GP) in C_MODULE_LIST), this security function provides to the SICESW developer the following very efficient basic functions:
 - points addition,
 - point doubling,
 - point multiplication.
- 183. In USER configuration, this security function implements the following standard hash function:
 - SHA-1 hash function chaining blocks of 512 bits to get a 160 bits result.

6.1.12 SF_ALEAS_A: Unpredictable Number Generation Support

- 184. In all configurations, this security function provides two unpredictable and unrelated 8 bits numbers.
- 185. In ISSUER and USER configurations, this security function supports the prevention of information leakage.
- 186. This security function ensures the generation of unpredictable numbers of 1088 bits, in USER configuration.
- 187. This security function can be qualified, with:
 - the test metrics required by the NIST FIPS PUB-140-2:1999 standard for a Security Level 3 cryptographic module (statistical test upon demand),
 - the test metrics required by the BSI-AIS31 standard for a P2 class device.

6.2 Statement of assurance measures

188. The *ST19NR66-A Documentation Report* shows the assurance measures, through a list of documents delivered, which are claimed to satisfy the stated assurance requirements.

7 PP CLAIMS

7.1 PP references

- 189. The ST19NR66-A Security Target **is compliant with** the requirements of the *Smartcard Integrated Circuit* Protection Profile *PP/9806*, *Revision 2.0*.
- 190. The ST19NR66-A Security Target **is compliant with** the requirements of the *Smartcard IC Platform* Protection Profile *BSI-PP-002-2001*, *Revision 1.0*.

7.2 PP refinements

- 191. The main refinements operated on the *PP/9806* are:
 - "Smartcard product" is refined into "Secure IC based product" to emphasize the packaging independence of the TOE,
 - The product lifecycle is refined to include industrial parameters such as the delivery phase and the sites where the lifecycle processes are performed,
 - The SFR applicable to phase 3 are refined to be applicable to the logical phases TEST and ISSUER configurations.
- 192. *PP/9806* refinements are indicated with type setting text *as indicated here*, original text being typeset as indicated here. Text originating in *AUG* is typeset as indicated here.
- 193. The main refinements operated on the BSI-PP-002-2001 are:
 - The definition of "Test Features" in the Limited capabilities (FMT_LIM.1) policy,
 - Addition #1: "Support of Cipher Schemes" from AUG,
 - Addition #4: "Area based Memory Access Control" from AUG,
 - Refinement of assurance requirements.
- 194. *BSI-PP-002-2001* refinements are indicated with type setting text *as indicated here*, original text being typeset as indicated here. Text originating in *AUG* is typeset as indicated here.

7.3 PP additions

- 195. The security environment additions relative to each PP are summarized in *Table 3*. Remind that most of them are redundant to each other but enable full traceability and rationale reuse.
- 196. The additional security objectives relative to each PP are summarized in *Table 4*. Remind that most of them are redundant to each other but enable full traceability and rationale reuse.
- 197. A simplified presentation of the TOE Security Policy (TSP) is added.
- 198. The additional SFRs for the TOE relative to each PP are summarized in *Table 5*. Remind that some of them are redundant to each other but enable full traceability and rationale reuse.
- 199. The additional SFRs for the environment relative to both PPs are summarized in *Table 14* and *Table 15*.
- 200. The additional SARs relative to each PP are summarized in *Table 12*.

7.4 PP claims rationale

- 201. The differences between this Security Target security objectives and requirements and those of *PP/9806* and those of *BSI-PP-002-2001*, to both of which conformance is claimed, have been identified and justified in *Chapter 4* and in *Chapter 5*. They have been recalled in the previous section.
- 202. The security objectives rationale referred to in *Section 4.3* clearly identifies modifications and additions made to the rationale presented in the *PP/9806* and in *BSI-PP-002-2001*.
- 203. Similarly, the security requirements rationale referred to in *Section 5.5* has been consistently updated with respect to both protection profiles.
- 204. All PP requirements have been shown to be satisfied in the extended set of requirements whose completeness, consistency and soundness has been argued in the rationale sections of the *ST19N Generic Security Target*.

8 Rationale

- 205. The rationale has been established for the whole ST19N platform and has been presented and evaluated in the *ST19N Generic Security Target*.
- 206. For confidentiality reasons, the rationale is not reproduced here.

Appendix A Glossary

Authentication data

Information used to verify the claimed identity of a user.

Authorised user

A user who may, in accordance with the TSP, perform an operation.

Cryptographic sensitive data (CSD)

User data appearing in plain text or otherwise unprotected form and whose disclosure or modification can compromise the security of a cryptographic module or the security of the information protected by the module.

Differential Power Analysis (DPA)

An analysis in variations of the electrical power consumption of a device, using advanced statistical methods and/or error correction techniques, for the purpose of extracting information correlated to secrets processed in the device. When several consumption traces are recombined during analysis to remove randomisation counter-measures, the analysis is known as Higher Order DPA (HODPA).

Embedded software

Software embedded in a **secure IC** may be **located** in any part of the nonvolatile memory **(ROM and NVM)** of the IC.

Secure IC based product

Packaged secure IC integrated in its end-usage carrier such as a Smartcard, a card reader, a set-top box, a PC board or any other suitable device.

Integrated Circuit (IC)

Electronic component(s) designed to perform processing and/or memory functions.

IC Dedicated Software

ST proprietary Dedicated SoftWare (DSW), embedded in ST_ROM, whose design is parameterised by the ST product assembly definition. This software contributes to the enforcement of the TSP. It also includes testing functionality and system libraries that are part of the API of the TOE; it is embedded in the IC (it is also known as IC firmware).

IC developer

Institution (or its agent) responsible for the IC development.

IC manufacturer

Institution (or its agent) responsible for the IC manufacturing, testing, and prepersonalization.

IC packaging manufacturer

Institution (or its agent) responsible for the IC packaging and testing.

IC pre-personalization data

Any data that is stored in the nonvolatile memory for shipment between phases.

Memory access

Read and Modification (Write, Erase, Program) access.

Object

An entity within the TSC that contains or receives information and upon which subjects perform operations.

Packaged IC

IC embedded in a physical package such as micromodules, DIPs, SOICs or TQFPs.

Personalizer

Institution (or its agent) responsible for the **secure IC based product** personalization and final testing.

Secret

Information that must be known only to authorised users and/or the TSF in order to enforce a specific SFP.

Secure IC Embedded SoftWare (SICESW)

Embedded software in charge of generic functions of the **secure IC** such as Operating System, general routines and interpreters (**secure IC** basic software) and embedded software dedicated to the applications (**secure IC** application software).

Secure IC embedded software developer

Institution (or its agent) responsible for the **secure IC** embedded software development and the specification of IC pre-personalization requirements, **if any**.

Security attribute

Information associated with subjects, users and/or objects that is used for the enforcement of the TSP.

Security derivation

The process by which a TOE summary specification is derived from the identification of the threatened assets in the TOE environment, establishing in turn: a security environment, a set of security objectives, a set of security requirements and finally a set of security functions and assurance measures (see CC, part 1, section 4.3 for a detailed explanation, notably figure 4.5).

Sensitive information

Any information identified as a security relevant element of the TOE such as:

- the application data of the TOE (such as IC pre-personalization requirements, IC and system specific data),
- the secure IC embedded software,
- the IC dedicated software,
- the IC specification, design, development tools and technology.

Simple Power Analysis (SPA)

A direct analysis, primarily visual, of patterns of instruction execution (or execution of individual instructions), obtained through monitoring the variations in electrical power consumption of a device, for the purpose of revealing the features and implementations of (cryptographic) algorithms and subsequently the values of the secrets they process in the device.

Smartcard

A card according to ISO 7816 requirements which has a non volatile memory and a processing unit embedded within it.

Software library

Set of software functions provided by ST in the DSW that implement driving and functional services offered to the embedded software of the secure IC based product.

Subject

An entity within the TSC that causes operations to be performed.

System integrator

Institution (or its agent) responsible for the **secure IC based** product system integration (terminal software developer, system developer ...).

TSF data

Data created by and for the TOE, that might affect the operation of the TOE.

User

Any entity (human user or external IT entity) outside the TOE that interacts with the TOE.

User data

Data created by and for the user, that doesn't affect the operation of the TOE.

Warm reset

Reset operation on the TOE without lowering power under the Power on Reset (POR) level.

Appendix B Abbreviations

ACC

Accumulator register.

AES

Advanced Encryption Standard.

AIS

Information in this document is provided solely in connection with ST products. STMicroelectronics NV and its subsidiaries ("ST") reserve the right to make changes, corrections, modifications or improvements, to this document, and the products and services described herein at any time, without notice.

All ST products are sold pursuant to ST's terms and conditions of sale.

Purchasers are solely responsible for the choice, selection and use of the ST products and services described herein, and ST assumes no liability whatsoever relating to the choice, selection or use of the ST products and services described herein.

No license, express or implied, by estoppel or otherwise, to any intellectual property rights is granted under this document. If any part of this document refers to any third party products or services it shall not be deemed a license grant by ST for the use of such third party products or services, or any intellectual property contained therein or considered as a warranty covering the use in any manner whatsoever of such third party products or services or any intellectual property contained therein.

UNLESS OTHERWISE SET FORTH IN ST'S TERMS AND CONDITIONS OF SALE ST DISCLAIMS ANY EXPRESS OR IMPLIED WARRANTY WITH RESPECT TO THE USE AND/OR SALE OF ST PRODUCTS INCLUDING WITHOUT LIMITATION IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE (AND THEIR EQUIVALENTS UNDER THE LAWS OF ANY JURISDICTION), OR INFRINGEMENT OF ANY PATENT, COPYRIGHT OR OTHER INTELLECTUAL PROPERTY RIGHT.

UNLESS EXPRESSLY APPROVED IN WRITING BY AN AUTHORIZED ST REPRESENTATIVE, ST PRODUCTS ARE NOT RECOMMENDED, AUTHORIZED OR WARRANTED FOR USE IN MILITARY, AIR CRAFT, SPACE, LIFE SAVING, OR LIFE SUSTAINING APPLICATIONS, NOR IN PRODUCTS OR SYSTEMS WHERE FAILURE OR MALFUNCTION MAY RESULT IN PERSONAL INJURY, DEATH, OR SEVERE PROPERTY OR ENVIRONMENTAL DAMAGE. ST PRODUCTS WHICH ARE NOT SPECIFIED AS "AUTOMOTIVE GRADE" MAY ONLY BE USED IN AUTOMOTIVE APPLICATIONS AT USER'S OWN RISK.

Resale of ST products with provisions different from the statements and/or technical features set forth in this document shall immediately void any warranty granted by ST for the ST product or service described herein and shall not create or extend in any manner whatsoever, any liability of ST.

ST and the ST logo are trademarks or registered trademarks of ST in various countries.

Information in this document supersedes and replaces all information previously supplied.

The ST logo is a registered trademark of STMicroelectronics. All other names are the property of their respective owners.
